

Alpha Cleantec AG Newsletter January 2023

Dear Madam or Sir,

We hope this email finds you well, healthy, and fully charged with energy after the pleasant winter holidays. Today we send you our next Newsletter containing the January updates.

From our R&D department, we are happy to provide you with a new update regarding customer projects.

The Problem: The Objective:		At the end of last year, we successfully accomplished a pilot test with one of the EU manufacturers of insulation boards and panels. One of the challenges of this manufactures was the generation of industrial wastewater with solvents and dioxane leftovers as a process byproduct. The target of the pilot was wastewater decontamination and increasing the flash point of this water.							
		Therefore, the customer intends to rapidly and cost-effectively decontaminate the industrial wastewater from organic materials and increase wastewater flash point to meet the EU threshold value regulation for the current contaminants.							
		We have implemented our SOA-AFA solution as a treatment agent based on a batch treatment approach. As shown below, our reagent is an efficient reagent for this type of wastewater, with a conversion of 87-90% after a single treatment. In addition, our agent efficiently increased the flash point of the wastewater.							
	lution:	based on a ba reagent is an ef conversion of 8	tch treatment appr ficient reagent for th 7-90% after a single	oach. As shown b is type of wastewat e treatment. In add	elow, our ter, with a dition, our

About Alpha Cleantec AG

We believe that our eco-system requires looking after so we have a world worth living in to pass to our next generations. Decontamination of soil and water from hazardous contaminants plays a major role in this regard, in our view. This is why we established Alpha Cleantec AG as an environmental technology company in 2016 with a vision to provide safe, green, rapid, efficient and cost effective technologies to resolve environmental harms and hazards caused by inadequate human and industrial activities.

For Decontamination for a wide range of contaminants, see table of contaminants below, we provide two technologies, AFA and SOA, achieving decontamination ratios of up to 97% in just hours (such as Hydrocarbons, BTEX, Petroleum leftovers, Aromatics, PAHS, Chlorinated Solvents, PCBs, Dioxins as well as Pesticides and Herbicides) to be applied for soil, groundwater, wastewater and railway ballast treatment.

For wastewater facilities we have developed based on our proprietary technology a process allowing to pretreat sludge before the digester, thereby significantly increasing biogas generation (up to 50%) and decreasing dry sludge disposal at the end of the process (up to 20%).

For Vegetation control we have developed a process based on an environmentally friendly mixture of inorganic salts that generates concentrated (non-Glyphosate) herbicide absorbing water from the plants and drying the plant including the roots (without changing the salinity of the soil).
